## Work completed this week

This week, we focused on styling the HTML pages using Tailwind CSS to build a modern and responsive user interface.

We applied utility classes directly within the HTML to design the layout and improve the overall appearance of the system. All main pages (Home, Menu, Login, Register, Cart, and Admin Dashboard) were styled consistently based on the UI wireframes.

We also ensured that the website is fully responsive across different screen sizes using Tailwind's responsive design utilities. The project structure and GitHub repository were updated accordingly.

## Features implemented

- Styled all pages using Tailwind CSS utility classes
- Applied consistent design (colors, spacing, typography)
- Built responsive layouts using Tailwind breakpoints (sm, md, lg)
- Styled forms (inputs, buttons, validation states)
- Designed navigation bar and page sections
- Improved UI using Tailwind components (cards, grids, flex layouts)
- Optimized layout for mobile, tablet, and desktop

## **Problems encountered**

We initially faced some difficulty understanding how to properly use Tailwind utility classes for complex layouts.

Managing long class names inside HTML elements also made the code harder to read in some cases.

Additionally, achieving consistent design across all pages required careful planning.

## **Solutions applied**

To solve these issues, we followed Tailwind documentation and practiced using utility classes effectively.

We reused common class patterns across pages to maintain consistency.

We also structured the HTML carefully and grouped related classes to improve readability.

Testing was done using different screen sizes to ensure responsiveness.

## **Plan for next week**

Next week, we will integrate JavaScript to add interactivity to the website.

This includes DOM manipulation, client-side form validation, and implementing UI components such as modals, dropdown menus, and sidebars.

## **Questions for instructor**

Is using Tailwind CSS sufficient for styling?
