Work completed this week

This week focused on implementing interactivity using React Hooks and the Context API. The following tasks were completed:

- Integrated JavaScript interactivity into the user interface
- Used useState and useEffect for state and lifecycle management
- Implemented Context API for global state management (e.g., cart and user data)
- Added dynamic behaviors such as
 - Updating cart items in real-time
 - Handling user input and form interactions
 - Conditional rendering for UI elements

Features implemented

- Add to Cart functionality
- Update and remove items from the cart
- Dynamic UI updates
- Global state management using Context API
- Interactive buttons and forms
- Basic input validation

Problems encountered

- Difficulty in managing shared state between multiple components
- Re-rendering issues when updating state
- Passing props deeply between components (prop drilling)

Solutions applied

- Used Context API to eliminate prop drilling
- Organized components into smaller reusable units
- Used debugging tools like browser DevTools

Plan for next week

- Use Fetch/Axios for API calls
- Add loading indicator
- Implement instant search
- Handle errors and async operations
- Improve UX and performance

Questions for instructor

- What is the best practice for structuring large React projects?
